

CIEM42X0 Probabilistic Design

Hydraulic and Offshore Structures (HOS) Track

Civil Engineering MSc Program

Reliability-Based Design Philosophy

Robert Lanzafame

Note for reading the PDF

The following slides were used in class to illustrate these key points:

- In this unit it will be important to think about the problem you are analyzing and to ensure that it represents reality in an acceptable way mathematically
 - You know well now how to create univariate distributions; in this unit we will need to do this for several random variables and evaluate a multivariate distribution.
 - Refer to the textbook for understanding why the integration areas shown may be “incorrect”
 - Do the exercises in Chapter 1!!!
- Recognize where the reliability analysis and risk analysis concepts in this unit fit into a typical design cycle.
 - In the “analyze” phase we are evaluating probabilities (especially failure probabilities), whereas in the “evaluate” phase we are checking whether or not our structure/system meets the specified “norm”
 - The “norm” varies widely by industry and application (each B module will be very different in this regard, in fact). Ideally the standards are at least risk-informed (e.g., economically advantageous offshore renewables, tunnel life safety), if not entirely risk-based (e.g., Dutch flood protection)
 - In this unit we don’t focus on deriving (or even using) the risk-based evaluation criteria, but it is important to keep in mind that this will play a big role in your engineering practice!

Risk Analysis

Probability of exceedance (1/yr)

N (Fatalities)

Reliability Analysis

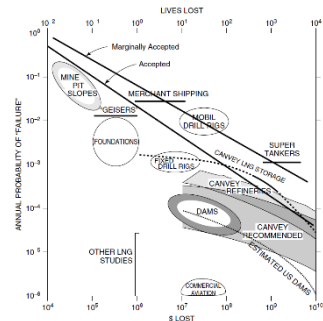

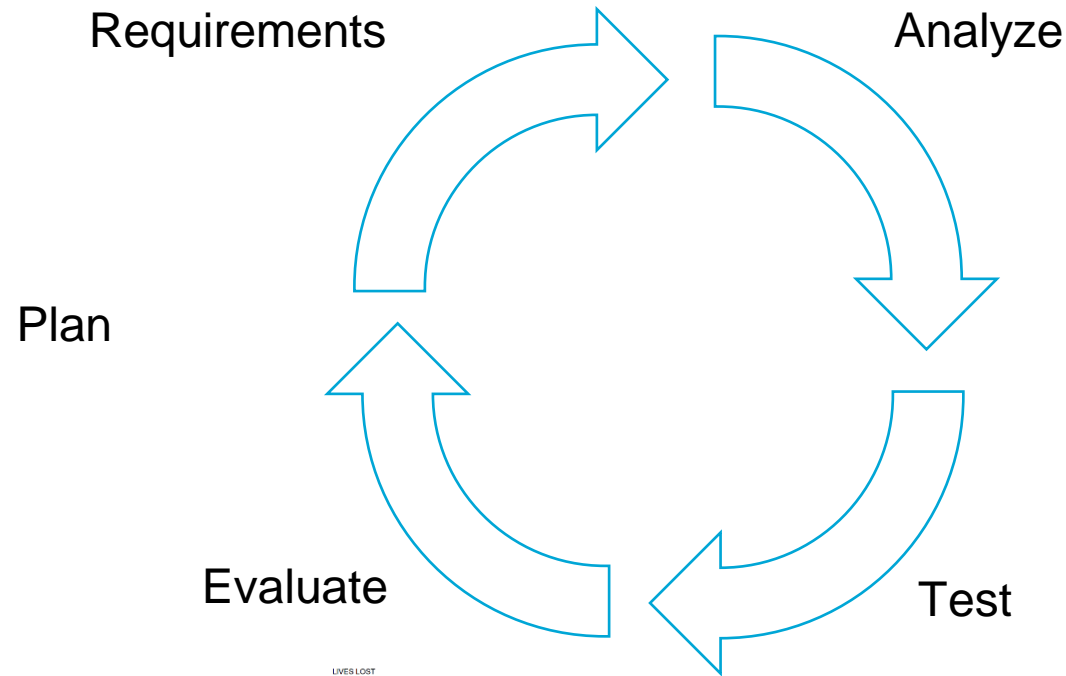

Reliability Analysis

Reliability Analysis

Reliability-Based Design Philosophy

How we will approach reliability-based design

- Risk Analysis: evaluation, assessment, context (MUDE)
- Continuous Distributions, Extreme Value Analysis (MUDE, Week 2)
- → Dependence touched lightly
(covered in cross-over!!! CEGM2005 tudelft-city.github.io/MORE)
- Component Reliability:
a function of random variables $p_f = \int_{\Omega} f_X(x) dx$
- System Reliability:
build on MUDE:, solving complex systems

Summary of Reliability-Based Design Philosophy

- Reliability methods for analysing and evaluating structures/system
- Risk analysis provides a framework for evaluation
- We will apply this to your design case in our unit!
